Checking for a Missed Peak in a Heat Test

Question 1

Choice (3)

The largest listed reading is 36 °C. The table gives no measurement between the listed times.

Question 2

Both read 36 °C, but the temperature could have risen above 37 °C and fallen again between those two readings.

Question 3

The peak record of 39 °C is above the limit. The individual readings missed that maximum, so the pack fails the stated rule.

Question 4

Record temperature more often or continuously, and retain the time of each reading. A recorder that stores the maximum and its timestamp would also show when the high temperature occurred.
